## Bright Sparkle Effects With Pure Saturated Colors

PRITTY Diamond Interference Pigments are based on mirror-like borosilicate platelets for maximum color, brightness, transparency, reflectivity and enhanced visual depth.

Black or darker backgrounds give the best diamond effect. High gloss media enhances the color highlighting effect.

Available in 6 interference colors with 2 particle sizes; 30-100um & 50-250um

The dosage of diamond is less than traditional pearls, 2-3%. Applications include but not limited to baking varnish, decorative paints, automotive paints, powder coating and Synthetic leather.

Even with a dosage of 0.5% gives an impressive starry effect.
